

Performance after excluding D-SCRIPT and X-PAIR default exposure

Exclude proteins in D-SCRIPT human TRAIN or X-PAIR default TRAIN + DEV (interaction / interface)

- Original Bennett | 1,073 pairs | 566 positive (52.7%)
- ◆ Custom ILP negatives | 1,057 pairs | 566 positive (53.5%)

Retained pairs have neither protein in the named exposure list; all 12 models use the same rows within each test.

Dashed lines: AP = subset positive fraction; AUROC = 0.5. Point estimates only; no confidence intervals.

Both exposure lists are applied together; about 2% of each full test remains. Homology and pretraining exposure are not filtered.
