

Performance after removing D-SCRIPT-exposed proteins

Exposure source: D-SCRIPT original public human training data

- Original Bennett | 4,264 pairs | 2,287 positive (53.6%)
- ◆ Custom ILP negatives | 4,441 pairs | 2,287 positive (51.5%)

Retained pairs have neither protein in the named exposure list; all 12 models use the same rows within each test.

Dashed lines: AP = subset positive fraction; AUROC = 0.5. Point estimates only; no confidence intervals.

This also removes identified human V11 source exposure; X-PAIR default exposure can remain. Homology and pretraining exposure are not filtered.
