

Performance after removing X-PAIR default-exposed proteins

Exposure source: X-PAIR default TRAIN + DEV, interaction and interface tasks

- Original Bennett | 3,562 pairs | 1,838 positive (51.6%)
- ◆ Custom ILP negatives | 3,413 pairs | 1,838 positive (53.9%)

Retained pairs have neither protein in the named exposure list; all 12 models use the same rows within each test.

Dashed lines: AP = subset positive fraction; AUROC = 0.5. Point estimates only; no confidence intervals.

This removes X-PAIR default exposure; human V11 source exposure can remain. Homology and pretraining exposure are not filtered.
